KINGSTON CLASS PATROL SHIPS
(MARITIME COASTAL DEFENCE VESSELS)

Updated September 2022

The Royal Canadian Navy (RCN) has a diverse set of missions it undertakes at home and around the world and, while it is a combat force equipped with sophisticated weapons, it is also responsible for a host of day-to-day duties for which high-end combat power is not needed. Canada's naval strategy names several such tasks, including defence of Canadian sovereignty, securing Canada’s maritime approaches, contributing to maritime peace and good order abroad, and strengthening partnerships around the world. Within these broad categories fall a myriad of important tasks, such as drug interdiction, fisheries patrol, route surveying and support to civilian agencies. For these tasks the RCN often employs the Kingston-class patrol ships, also known as the Maritime Coastal Defence Vessels (MCDVs).

The Kingston-class MCDVs are small patrol ships, measuring 55.3 metres in length and 11.3 metres in width, and displacing 970 tons. They are crewed by 30-36 regular force and reserve force personnel. Canada currently has 12 MCDVs, deployed evenly between the East and West Coasts. The ships were built and launched from the mid- to late 1990s by Halifax Shipyards Ltd, owned by Saint John Shipbuilding of Canada, as a replacement for the RCN’s ageing Anticosti-class and Bay-class vessels. Not required to conduct combat operations, they were intended to be economical additions to the fleet and were built with commercial, off-the-shelf, equipment. Although the MCDVs were conceived during the Cold War, their construction occurred after the Cold War ended. The Kingston-class was part of the ambitious 1987 White Paper (which also recommended a small fleet of nuclear attack submarines) produced by the government of Brian Mulroney. The White Paper summed up the need for new patrol craft by pointing to obvious shortfalls in RCN capacity, stating the “maritime forces have too few operational vessels, very limited capacity to operate in the Arctic and no capability to keep Canadian waterways and harbours clear of mines.”

To meet this need, the Kingston-class was designed with general-purpose patrol and minesweeping capability. While minesweeping is still listed as a role, that requirement was reduced with the end of the Cold War. The necessary minesweeping equipment is no longer available, and the capability is now largely theoretical. As minesweepers, the ships were compromise builds. Their propulsion systems were designed to reduce their acoustic signatures to defend against acoustic mines, however their hulls are made of steel rather than the wood or fiberglass that modern minesweepers often use to avoid magnetic mines. Nonetheless, in August 2022 HMCS Kingston and HMCS Summerside participated in an operation of Standing NATO Mine Countermeasures Group 1 to locate and destroy ordnance in the English Channel which was left over from WWII.

The Kingston-class was initially equipped with light armament. This included a Bofors 40 mm Model 60 Mk 5C rapid fire gun mounted on the forecastle deck and two 12.7 mm (.50 calibre) machine guns. The Bofors gun was a WWII design which needed to be manually loaded and lacked any modern targeting capability. In 2014 it was judged obsolete and removed from the ships, and they now rely on their machine guns for defence. Being so lightly armed, the
MCDVs are not intended for combat. Instead, they have been used by the RCN as training vessels and as general-purpose ships which conduct domestic coastal surveillance and patrol, search and rescue, resource protection and fisheries patrols in support of the Department of Fisheries and Oceans, as well as support to law enforcement and other civilian agencies. Rather than defence against state-based adversaries, these patrol ships focus on security missions, working with the RCMP and other government departments to ensure that Canadian law and regulations are respected in Canada’s territorial sea, fishing areas and ocean space over which Canada exercises jurisdiction. In the 2000s, in addition to these domestic roles, the MCDVs took on a larger role as the RCN’s Halifax-class frigates went through their mid-life modernization. This led them to deployments further afield and, as stated in navy strategy, “across a wide range of domestic and continental defence and security missions.” As part of this, ships of the Kingston-class have undertaken drug-interdiction missions in partnership with the US Navy and Coast Guard. For example, Operation Caribbe is Canada’s participation in the US-led Operation Martillo, a multinational campaign against illicit trafficking by transnational organized crime in the Caribbean Sea and the eastern Pacific Ocean. Over the past years, these RCN ships have participated in the seizure of tonnes of cocaine and marijuana.

In addition to operations in the Western Hemisphere, MCDVs have been deployed across the Atlantic to West Africa. After a pause for two years because of the COVID pandemic, in January 2022, HMCS Goose Bay and Moncton crossed the Atlantic to conduct Operation Projection West Africa. Their four-month mission was to engage with states in West Africa to build partner capacity, promote maritime security and foster relationships in the Gulf of Guinea region. Goose Bay and Moncton also participated in Obangame Express 2022, an exercise led by US Naval Forces Africa (NAVAF) and designed to improve cooperation among participating states to increase maritime safety and security in the Gulf of Guinea.

While they are versatile platforms, the MCDVs suffer from some shortcomings, in addition to their lack of armament – i.e., they are limited by certain design choices. For patrol ships they are fairly slow, capable of only 15 knots (28 km/h) maximum continuous speed, and a range of about 9,000 km. As noted, when building the ships the RCN chose to combine minesweeping and patrol functions in a single class of vessel, thus compromising the speed of a patrol ship for the function of a minesweeper. The ships’ costs were reduced by using inexpensive low carbon steel and building to commercial rather than military standards. Lastly, also to reduce costs they were built with a short hull, which has had an impact on both sea-keeping and speed.

Age and use have taken their toll on the ships. They are now over 20 years old and suffer from chronic engine trouble and must be continually rotated in and out of service. There has been discussion over the years about whether to modernize the ships or to replace them entirely. A planned $100 million mid-life refit was cancelled after the ships were considered unworthy of a mid-life refit, largely owing to the limitations of the platforms. Instead, the RCN considered retiring them in the early 2020s. Leadmark 2050 called for a fleet of 12 new coastal patrol vessels. In 2017 the Standing Committee on National Defence made the same recommendation – assuming that these ships could be fit into the ongoing National Shipbuilding Strategy (see Briefing Note #6 about the NSS).

A ship-for-ship replacement of the Kingston-class MCDVs was rejected by the government in its response to the Standing Committee. Instead, it was assumed that the new Arctic Offshore and Patrol Ships (AOPS) would fill many of the roles which traditionally fell to the Kingston-class. (See Briefing Note #14 for discussion of the AOPS.) The government’s position was that the new AOPS would provide a “more complete set of capabilities.” The concern is that only six
AOPS are being built for the navy (with an additional two for the Canadian Coast Guard) and that the reduction in ship numbers will lead to reduced capacity across many areas. The announcement in May 2019 that up to 16 Multi-Purpose Vessels (MPVs) are to be constructed for the Coast Guard might ease this concern.\textsuperscript{10} The new MPVs will not be RCN ships but they may nonetheless reduce the pressure on RCN ships, allowing the AOPS to take on the naval missions that the MCDVs have recently begun to undertake.

\textsuperscript{7} In June 2006, Valérie Dufour, journalist with \textit{Le Journal de Montréal}, uncovered through an Access to Information Request that the RCN was abandoning its $100M mid-life refit plans for the MCDVs. Instead, the plan was to replace them with new vessels entering service in 2020. It had been intended to retain the \textit{Kingstons} until 2045-2055 but planners concluded that, in light of their performance, it was not efficient to do the refit the MCDVs.
